(54) Title: ANTIBACTERIAL COMPOUNDS

(57) Abstract: Compounds of formula (I) and formula (II) are disclosed which are useful in the treatment bacterial infections, wherein: R¹ is C₁₋₄alkyl, Ar or 2-thienyl or 3-thienyl; R² is C₁₋₄alkyl or Ar; and n is 0-3; or a pharmaceutically acceptable salt thereof.

TITLE

Antibacterial Compounds

FIELD OF THE INVENTION

5 This invention relates to pharmaceutically active compounds which are useful for the treatment of bacterial infections.

BACKGROUND OF THE INVENTION

10 There is a medical need for novel antibiotics and a market opportunity for new antibacterial agents. Thus, the object of this invention is to identify novel compounds having antibiotic activity.

15 While the overall pathway of saturated fatty acid biosynthesis is similar in all organisms, the fatty acid synthase (FAS) systems vary considerably with respect to their structural organization. Vertebrates and yeast possess a FAS in which all the enzymatic activities are encoded on one or two polypeptide chains, respectively, and the acyl carrier protein (ACP) is an integral part of the complex. In contrast, in bacterial FAS, each of the reactions is catalyzed by a distinct, mono-functional enzyme and the ACP is a discrete protein. Therefore, there is considerable potential for the selective inhibition of the bacterial system by antibacterial agents.

20 Fab I (previously designated EnvM) functions as an enoyl-ACP reductase (Bergler, et al, (1994), *J.Biol.Chem.* 269, 5493-5496) in the final step of the four reactions involved in each cycle of bacterial fatty acid biosynthesis. In this pathway, the first step is catalyzed by β -ketoacyl-ACP synthase, which condenses malonyl-ACP with acetyl-CoA (FabH, synthase III). In subsequent rounds, malonyl-ACP is condensed with the growing-chain acyl-ACP (FabB and FabF, synthases I and II, respectively). The second step in the elongation cycle is ketoester reduction by NADPH-dependent β -ketoacyl-ACP reductase (FabG). Subsequent dehydration by β -hydroxyacyl-ACP dehydrase (either FabA or FabZ) leads to trans-2-enoyl-ACP, which in turn is converted to acyl-ACP by NADH-dependent enoyl-ACP reductase (Fab I). Further rounds of this cycle, adding two carbon atoms per cycle, eventually lead to palmitoyl-ACP (16C), where upon the cycle is stopped largely due to feedback inhibition of Fab I by palmitoyl-ACP (Heath, et al, (1996), *J.Biol.Chem.* 271, 1833-1836). Thus, Fab I is a major biosynthetic enzyme and is a key regulatory point in the overall synthetic pathway of bacterial fatty acid biosynthesis. Therefore, Fab I is an ideal target for antibacterial intervention.

35 Studies have shown that diazaborine antibiotics inhibit fatty acid, phospholipid and lipopolysaccharide (LPS) biosynthesis and that the antibacterial target of these compounds is Fab I. For example, derivative 2b18 from Grassberger, et al (1984) *J. Med Chem* 27 947-

953 has been reported to be a non-competitive inhibitor of Fab I (Bergler, et al, (1994), *J.Biol.Chem.* 269, 5493-5496). Also, plasmids containing the Fab I gene from diazaborine resistant *S. typhimurium* conferred diazaborine resistance in *E.coli* (Turnowsky, et al, (1989), *J.Bacteriol.*, 171, 6555-6565). Furthermore, inhibition of Fab I either by
 5 diazaborine or by raising the temperature in a Fab I temperature sensitive mutant is lethal. These results demonstrate that Fab I is essential to the survival of the organism (Bergler, et al, (1994), *J.Biol.Chem.* 269, 5493-5496).

Recent studies have shown that Fab I is also the target for the broad spectrum antibacterial agent triclosan (McMurry, et al, (1998) *Nature* 394, 531-532). A crystal
 10 structure of the *E. Coli* Fab I complexed with NAD and triclosan shows that triclosan acts as a site-directed, very potent inhibitor of Fab I by mimicking its natural substrate (Levy, et al, (1999) *Nature* 398, 383-384). Ward, et al ((1999) *Biochem.* 38, 12514-12525) have shown that there is no evidence for the formation of a covalent complex between Fab I and triclosan, which would be analogous to the diazaborines; triclosan differs from these
 15 compounds in that it is a reversible inhibitor of Fab I. The structural data for the complex of Fab I with NAD and triclosan provides important information about Fab I as a therapeutic target.

Importantly, it has now been discovered that certain compounds have antibacterial activity and some of these antibacterial compounds are Fab I inhibitors. Therefore, the
 20 compounds of the present invention may be useful for the treatment of bacterial infections in mammals, particularly in man.

Compounds of formula (I) are prepared by methods analogous to those shown in Scheme 1. Alkyl or aryl aldehydes, such as the 1-Scheme 1 compound, are condensed with tosylmethylisocyanide in a dipolar cycloaddition catalyzed by sodium cyanide to give oxazolines, such as the 3-Scheme 1 compound. The oxazolines, for example the 3-Scheme 1 compound, are then heated with primary amines, such as 4-methylbenzylamine, to give the imidazoles of formula (I), such as the 4-Scheme 1 compound.

25

Compounds of formula (I) are prepared by methods analogous to those shown in Scheme 2. 4-Iodo-1H-imidazole, prepared according to Cliff and Pyne (*Synthesis*, 1994, 681-682) is condensed with a suitable organo-boronic acid, such as 2-Scheme 2, under Suzuki coupling conditions to give the corresponding substituted imidazole, 3-Scheme 2.

Typical Suzuki conditions use a catalytic amount of a Pd(0) catalysts, such as tetrakis(triphenylphosphine) palladium, and an excess of a base, such as sodium carbonate, in a polar solvent, such as dimethoxyethane and water. The substituted imidazole is then alkylated with an alkyl halide, such as 4-methoxybenzyl bromide, in the presence of a base, such as potassium carbonate, in a polar aprotic solvent, such as DMF to give an imidazole of formula (I), such as 4-Scheme 2. Other suitable alkylating agents include alkyl mesylates, alkyl tosylates and alkyl triflates.

Alternatively, compounds of formula (I) are generally prepared as described in Scheme 3.

Scheme 3

Compounds of formula (I) are prepared by methods analogous to those shown in Scheme 3. A primary amine, such as 1-Scheme 3, is condensed with an aryl substituted tosyl methyl isocyanates, such as 2-Scheme 3, in the presence of glyoxylic acid and a base, such as K_2CO_3 , to give a compound of formula (I), such as 3-Scheme 3. The substituted tosyl methyl isocyanate, 2-Scheme 3, is prepared according to Sisko, Mellinger, Sheldrake and Baine (*Tetrahedron Letters*, 1996, 37(45), 8113-8116).

Compounds of formula (II) are prepared by methods analogous to those shown in Scheme 4. Aryl or alkyl nitriles, such as the 1-Scheme 4 compound, are converted to the

corresponding amidine, such as the 2-Scheme 4 compound, via the corresponding imidate. The amidines are condensed with suitable alpha halo ketones, such as the 3-Scheme 4 compound, to give compounds of formula (II), such as the 4-Scheme 4 compound.

5 The formula (I) and formula (II) compounds of the present invention may also be prepared by methods known to those skilled in the art. For example, compounds of formula (I) may be synthesized according to the method of Horne, D.A.; Yakushijin, K.; Büchi, G. *Heterocycles*, 1994, 39, 139-153 and compounds of formula (II) may be synthesized according to the method of Caroon, J.M.; Clark, R.D.; Kluge, A.F.; Olah, R.; Repke, D.B.; Unger, S.H.; Michel, A.D.; Whiting, R. L. *J. Med. Chem.*, 1982, 25(6), 666-670. Reference
10 should be made to said articles for their full disclosure, particularly to the methods of preparing the compounds described therein, said disclosures being incorporated herein by reference.

Acid addition salts of the compounds of the invention are prepared in a standard manner in a suitable solvent from the parent compound and an excess of an acid, such as
15 hydrochloric, hydrobromic, hydrofluoric, sulfuric, phosphoric, acetic, trifluoroacetic, maleic, succinic or methanesulfonic. Certain of the compounds form inner salts or zwitterions which may be acceptable. Cationic salts are prepared by treating the parent compound with an excess of an alkaline reagent, such as a hydroxide, carbonate or alkoxide, containing the appropriate cation; or with an appropriate organic amine. Cations
20 such as Li^+ , Na^+ , K^+ , Ca^{++} , Mg^{++} and NH_4^+ are specific examples of cations present in pharmaceutically acceptable salts.

This invention also provides a pharmaceutical composition which comprises a compound according to formula (I) or formula (II) and a pharmaceutically acceptable carrier. Accordingly, the compounds of formula (I) and formula (II) may be used in the
25 manufacture of a medicament. Pharmaceutical compositions of the compounds of formula (I) and formula (II) prepared as hereinbefore described may be formulated as solutions or lyophilized powders for parenteral administration. Powders may be reconstituted by addition of a suitable diluent or other pharmaceutically acceptable carrier prior to use. The liquid formulation may be a buffered, isotonic, aqueous solution. Examples of suitable
30 diluents are normal isotonic saline solution, standard 5% dextrose in water or buffered sodium or ammonium acetate solution. Such formulation is especially suitable for parenteral administration, but may also be used for oral administration or contained in a metered dose inhaler or nebulizer for insufflation. It may be desirable to add excipients such as polyvinylpyrrolidone, gelatin, hydroxy cellulose, acacia, polyethylene glycol,
35 mannitol, sodium chloride or sodium citrate.

Alternately, these compounds may be encapsulated, tableted or prepared in a emulsion or syrup for oral administration. Pharmaceutically acceptable solid or liquid

carriers may be added to enhance or stabilize the composition, or to facilitate preparation of the composition. Solid carriers include starch, lactose, calcium sulfate dihydrate, terra alba, magnesium stearate or stearic acid, talc, pectin, acacia, agar or gelatin. Liquid carriers include syrup, peanut oil, olive oil, saline and water. The carrier may also include a
5 sustained release material such as glyceryl monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies but, preferably, will be between about 20 mg to about 1 g per dosage unit. The pharmaceutical preparations are made following the conventional techniques of pharmacy involving milling, mixing, granulating, and
10 compressing, when necessary, for tablet forms; or milling, mixing and filling for hard gelatin capsule forms. When a liquid carrier is used, the preparation will be in the form of a syrup, elixir, emulsion or an aqueous or non-aqueous suspension. Such a liquid formulation may be administered directly p.o. or filled into a soft gelatin capsule.

For rectal administration, the compounds of this invention may also be combined with excipients, such as cocoa butter, glycerin, gelatin or polyethylene glycols, and molded
15 into a suppository.

For topical administration, the compounds of this invention may be combined with diluents to take the form of ointments, gels, pastes, creams, powders or sprays. The compositions which are ointments, gels, pastes or creams contain diluents, for example, animal and vegetable fats, waxes, paraffins, starch, tragacanth, cellulose derivatives,
20 polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures of these substances. The compositions which are powders or sprays contain diluents, for example, lactose, talc, silicic acid, aluminum hydroxide, calcium silicate and polyamide powder, or mixtures of these substances. Additionally, for topical ophthalmologic administration, the typical carriers are water, mixtures of water and water miscible solvents,
25 such as lower alkanols or vegetable oils, and water-soluble non-toxic polymers, for example cellulose derivatives, such as methyl cellulose.

The compounds described herein are useful for treating bacterial infections. Also, certain compounds of this invention are Fab I inhibitors. For instance, these compounds are useful for the treatment of bacterial infections, such as, for example, infections of upper
30 respiratory tract (e.g. otitis media, bacterial tracheitis, acute epiglottitis, thyroiditis), lower respiratory (e.g. empyema, lung abscess), cardiac (e.g. infective endocarditis), gastrointestinal (e.g. secretory diarrhoea, splenic abscess, retroperitoneal abscess), CNS (e.g. cerebral abscess), eye (e.g. blepharitis, conjunctivitis, keratitis, endophthalmitis, preseptal and orbital cellulitis, dacryocystitis), kidney and urinary tract (e.g. epididymitis, intrarenal and
35 perinephric abscess, toxic shock syndrome), skin (e.g. impetigo, folliculitis, cutaneous abscesses, cellulitis, wound infection, bacterial myositis), and bone and joint (e.g. septic

arthritis, osteomyelitis). Also, the compounds of this invention may be useful as antifungal agents.

The compounds of this invention are administered to the patient, in a manner such that the concentration of drug is sufficient to treat bacterial infections. The pharmaceutical composition containing the compound is administered at an oral dose of between about 10 mg to about 1000 mg, taken once or several times daily, in a manner consistent with the condition of the patient. Preferably, the oral dose would be about 50 mg to about 500 mg, although the dose may be varied depending upon the age, body weight and symptoms of the patient. For acute therapy, parenteral administration is preferred. An intravenous infusion of the compound of formula (I) in 5% dextrose in water or normal saline, or a similar formulation with suitable excipients, is most effective, although an intramuscular bolus injection is also useful. The precise level and method by which the compounds are administered is readily determined by one skilled in the art.

The compounds may be tested in one of several biological assays to determine the concentration of compound which is required to have a given pharmacological effect.

Cloning of *S. aureus* FabI:

The *fabI* gene was cloned from the chromosomal DNA of *S. aureus* strain WCUH29 using the polymerase chain reaction. Amplification was performed using *Taq* DNA polymerase (BRL) and the following primers:

5'-CGCCTCGAGATGTTAAATCTTGAAAACAAAACATATGTC-3' and
5'-CGCGGATCCAATCAAGTCAGGTTGAAATATCCA-3' (*Xho*I and *Bam*HI sites underlined). The resulting fragment was then digested with *Xho*I and *Bam*HI and ligated into *Xho*I- and *Bam*HI-digested expression vector pET-16b (Novagen), producing pET-His₁₀-*fabI*. The gene sequence of *fabI* was confirmed by automated cycle sequencing using an Applied Biosystems model 377 machine. The untagged version of pET-*fabI* was constructed by digesting pET-His₁₀-*fabI* with *Nco*I and *Nde*I to remove a 97 bp fragment encoding the His 10 tag, the factor Xa cleavage site and the first 8 amino acids of FabI, and replacing it with a linker encoding the first 8 amino acids of FabI plus a glycine residue between the initiator methionine and the lysine at position 2. This plasmid was called pET-*fabI*. The linker was made by annealing the following two oligonucleotides:

5'-CATGGGCTTAAATCTTGAAAACAAAACA-3' and
5'-TATGTTTTGTTTTCAAGATTTAAGCC-3'. The linker sequence in pET-*fabI* was confirmed by dideoxy sequencing. Only native FabI was used for compound evaluation. For overproduction of native FabI, plasmid pET-*fabI* was transformed into BL21(DE3) (Novagen) cells, to form strain BL21(DE3):pET-*fabI*.

Purification of *S. aureus* FabI

S. aureus FabI was expressed as soluble protein to 10% of total cell protein, 400g cells
5 being recovered from 15L fermentation in tryptone phosphate medium. The cells were
lysed and the sample centrifuged. The resulting supernatant was filtered and purified using
three consecutive chromatography columns: ion-exchange (Source 15Q), dye-affinity (Blue
sepharose), and size exclusion chromatography columns (Superose 12). After each column
the FabI containing fractions were pooled, concentrated, and checked for purity and
10 biological activity.

Cloning of *E. coli* FabI:

A PCR fragment of correct size for *E. coli* FabI was PCR amplified from *E. coli*
15 chromosomal DNA, subcloned into the TOPO TA cloning vector, and verified by colony
PCR + restriction endonuclease analysis. The presumptive *E. coli* FabI PCR fragment was
subcloned into the expression vector pBluePet. The FabI clone was transformed into *E.*
coli strain BL21(DE3). Small Scale expression studies show an over-expressed protein
band of correct molecular weight (~28 Kda) for *E. coli* FabI clearly visible following
20 Coomassie staining of SDS PAGE gels. DNA sequencing of the *E. coli* FabI expression
constructs illustrated that no errors were apparent. N' terminal amino acid sequencing has
confirmed the over-expressed protein band to be *E. coli* FabI.

Purification of *E. coli* FabI

25 *E. coli* FabI was expressed as soluble protein to 15% of total cell protein, 120g cells being
recovered from 3L fermentation in shake flasks in modified terrific broth. The cells were
lysed and the sample centrifuged. The resulting supernatant was filtered and purified using
three consecutive chromatography columns: ion-exchange (Source 15Q), dye-affinity (blue
sepharose), and size exclusion (superose 12). After each column the FabI containing
30 fractions were pooled, concentrated and checked for purity and biological activity.

S. aureus FabI Enzyme Inhibition Assay:

35 Assays were carried out in half-area, 96-well microtitre plates. Compounds were evaluated
in 50-uL assay mixtures containing 100 mM NaADA, pH 6.5 (ADA = N-[2-acetamido]-2-
iminodiacetic acid), 4 % glycerol, 0.25 mM crotonoyl CoA, 1 mM NADH, and an

appropriate dilution of *S. aureus* FabI. Inhibitors were typically varied over the range of 0.01-10 μ M. The consumption of NADH was monitored for 20 minutes at 30 °C by following the change in absorbance at 340 nm. Initial velocities were estimated from an exponential fit of the non-linear progress curves represented by the slope of the tangent at $t = 0$ min. IC₅₀'s were estimated from a fit of the initial velocities to a standard, 4-parameter model and are typically reported as the mean \pm S.D. of duplicate determinations. Triclosan, a commercial antibacterial agent and inhibitor of FabI, is currently included in all assays as a positive control.

10 *E. coli* FabI Enzyme Inhibition Assay:

Assays were carried out in half-area, 96-well microtitre plates. Compounds were evaluated in 150- μ L assay mixtures containing 100 mM NaADA, pH 6.5 (ADA = N-[2-acetamido]-2-iminodiacetic acid), 4 % glycerol, 0.25 mM crotonoyl CoA, 50 μ M NADH, and an appropriate dilution of *E. coli* FabI. Inhibitors were typically varied over the range of 0.01-10 μ M. The consumption of NADH was monitored for 20 minutes at 30 °C by following the change in absorbance at 340 nm. Initial velocities were estimated from an exponential fit of the non-linear progress curves represented by the slope of the tangent at $t = 0$ min. IC₅₀'s were estimated from a fit of the initial velocities to a standard, 4-parameter model and are typically reported as the mean \pm S.D. of duplicate determinations. Triclosan, a commercial antibacterial agent and inhibitor of FabI, is currently included in all assays as a positive control.

25 Antimicrobial Activity Assay:

Whole-cell antimicrobial activity was determined by broth microdilution using the National Committee for Clinical Laboratory Standards (NCCLS) recommended procedure, Document M7-A4, "Methods for Dilution Susceptibility Tests for Bacteria that Grow Aerobically". The compound was tested in serial two-fold dilutions ranging from 0.06 to 64 mcg/mL. A panel of 12 strains were evaluated in the assay. This panel consisted of the following laboratory strains: *Staphylococcus aureus* Oxford, *Staphylococcus aureus* WCUH29, *Streptococcus pneumoniae* 1629, *Streptococcus pneumoniae* N1387, *Streptococcus pneumoniae* ERY2, *Enterococcus faecalis* I, *Enterococcus faecalis* 7, *Haemophilus influenzae* Q1, *Haemophilus influenzae* NEMC1, *E. coli* 7623 (AcrAB⁺), *E. coli* 120 (AcrAB⁻), and *Morexalla catarrhalis* 1502. The minimum inhibitory concentration (MIC) was determined as the lowest concentration of compound that inhibited visible growth. A mirror reader was used to assist in determining the MIC

endpoint.

One skilled in the art would consider any compound with a MIC of less than 256 $\mu\text{g/mL}$ to be a potential lead compound. Preferably, the compounds used in the antimicrobial assays of the present invention have a MIC value of less than 128 $\mu\text{g/mL}$.

5 Most preferably, said compounds have a MIC value of less than 64 $\mu\text{g/mL}$.

The examples which follow are intended in no way to limit the scope of this invention, but are provided to illustrate how to make and use the compounds of this invention. Many other embodiments will be readily apparent to those skilled in the art.

Example 92

Parenteral Dosage Unit Composition

5 A preparation which contains 20 mg of the compound of Example 1 as a sterile dry powder is prepared as follows: 20 mg of the compound is dissolved in 15 mL of distilled water. The solution is filtered under sterile conditions into a 25 mL multi-dose ampoule and lyophilized. The powder is reconstituted by addition of 20 mL of 5% dextrose in water (D5W) for intravenous or intramuscular injection. The dosage is thereby determined by the
10 injection volume. Subsequent dilution may be made by addition of a metered volume of this dosage unit to another volume of D5W for injection, or a metered dose may be added to another mechanism for dispensing the drug, as in a bottle or bag for IV drip infusion or other injection-infusion system.

AB Title compds. (I, II; R1 = alkyl, aryl, thienyl; R2 = alkyl, aryl; n = 0-3), were prepared as antibacterials (no data). Thus, tosylmethyl isocyanide was stirred with 2-thiophenecarboxaldehyde and NaCN in EtOH to give (4R*,5S*)-5-(2-thienyl)-4-toluenesulfonyl-4,5-dihydro-1,3-oxazole. This was heated with PhCH2NH2 in PhMe to give 1-benzyl-4-(2-thienyl)-1H-imidazole. Tablet, capsule, and injection formulations containing the latter

are given.
